

IMTS readers' choice

SOFTWARE products

Tooling & Production has invited IMTS 2008 exhibitors to share their latest innovations with readers before the doors of Chicago's McCormick Place open in September. This month, *T&P* focuses on software products.

In the coming months, *T&P* will feature laser and waterjet marvels, abrasive machining products, and the best in turning and machining.

Use the Rleads addresses at the end of each listing to receive more information directly from the company. *T&P* will gauge the level of interest in each product and determine the Readers' Choice winners, which will be featured in the big August pre-show issue.

Sniffing out errors

Vericut software enables NC programmers to reduce errors, potential collisions and areas of inefficiency for faster, cleaner production. Machine simulation detects problems before they occur for machine tool components such as axis slides, heads, turrets, rotary tables, spindles, tool changers, fixtures, work pieces, cutting tools, and other user-defined objects. Vericut enables users to perform 3D simulation to create accurate collision-detection, making for cleaner production and a safer, more efficient environment. **CG Tech, Booth D-3035, www.rsleads.com/804tp-197**
